

What the platform does

The complete feature set, read from the codebase. Every item below is built and reachable in the product — no roadmap, no "coming soon". Grouped by area for reference; sequence and emphasis are yours to decide.

08 Payroll controls	18 Income tax & proofs	28 Applications
09 Time tracking	19 Expenses & benefits	
10 Attendance	20 Recruitment	

The monthly run, from draft to disbursed, with every stage recorded.

Monthly payroll run	A dated run per pay period with a full lifecycle — draft → locked → approved → released → disbursed — each transition stamped with the actor and the time it happened.
Automatic processing	Processes the whole organisation or a selected group. Runs as a queued background job with pollable progress, so a large payroll does not tie up the browser.
Concurrency protection	A second attempt to start a run that is already processing is refused outright rather than producing duplicate items.
Per-employee processing	Reprocess one employee inside an open run without touching anybody else's figures.
Attendance sync	Pulls attendance, leave, loss of pay and overtime into the run through a single action, per run or per employee, with an inspectable sync status.
Loss of pay & pro-rating	LOP deduction computed on payable wages before statutory deductions, capped at gross. Joiners and leavers pro-rated on a configurable day basis — calendar days, working days or a fixed 30.
Off-cycle runs	A separate run outside the normal cycle for bonuses, incentives, corrections or one-off payments.
On-demand salary	Release earned salary to an employee ahead of the pay date, recovered in the regular run.
Arrears	Back-dated pay differences computed against the salary that was actually in force on each affected day, not against today's figure.
Payroll adjustments	Ad-hoc additions and deductions on a single payslip, each carrying a reason.
Signed net pay	A negative net pay is surfaced, not clamped to zero — so an over-recovery is visible before it is paid rather than silently absorbed.
Payslips	Generated per employee per month, downloadable as PDF, distributed by email, and viewable by the employee in the portal and mobile app.
Year-to-date history	Running YTD figures per component per employee, carried across runs and used for cumulative tax.
Guided setup	A ten-step first-time configuration — welcome, defaults, pay schedule, statutory, departments, employees, bank, compliance and a test run — before anything goes live.

02 Salary structures & components

11 features

How a CTC becomes a set of components, and how those components are defined.

CTC breakdown	Annual CTC resolves into earnings, deductions and employer contributions, with a residual component that balances the structure back to CTC exactly.
Salary templates	Reusable structures defining basic, HRA, conveyance, DA, CCA, education, internet, meal, transport, uniform, books & periodicals, fuel & maintenance, NPS and VPF — plus unlimited custom earnings and deductions.
Percentage components	Components expressed as a percentage of CTC or of basic, resolved at compute time.
Formula components	A formula engine for components computed from an expression over other components.
Slab components	Components whose value steps by band — different amounts at different salary levels.
Lookup components	Components resolved from a lookup table rather than a calculation.
CTC range bands	Different structures applied automatically by CTC band, so a junior and a senior on the same template still get appropriate splits.
Pay groups	Employees grouped for payroll purposes, each group carrying its own pay schedule, filing details and component gating.
Department templates	Default payroll settings per department, inherited by employees unless overridden.
Daily wage structures	Wage definitions for daily-rated and contract workers, distinct from monthly salaried structures.
Live breakdown preview	Enter a CTC and see the full component split, statutory deductions and net pay before saving — including a custom mode that accepts either a percentage or an exact rupee amount for basic and HRA.

03 Salary overrides

10 features

Changing one employee's component to an exact figure, under governance.

Component override	Set basic or HRA to an exact annual amount for an individual, overriding what the structure would calculate.
Refusal at entry	An override that cannot balance against CTC is refused as it is typed , and the message names the largest value that would work — rather than accepting it and failing at finalisation.

Cost preview	Shows what the change costs before it is committed. Raising basic by ₹1 draws about ₹1.67 from the balancing allowance, because HRA, employer PF and gratuity all move with it.
Editable grid	All employees in one table with inline editing, annual or monthly view, structure filter and search — edit many rows, update in one action.
CSV round trip	Export the current view, edit in a spreadsheet, upload it back. Validation runs before anything is written and reports errors per row with the spreadsheet row number, the reason, and how to fix it.
Maker-checker	An override is proposed, then separately approved, rejected or cancelled. Nobody can approve a change to their own pay.
Dated lifetimes	Every override has an effective-from date and an optional effective-to. One mechanism covers permanent, this-month-only, until-cancelled and range-bound.
Both values kept	The register stores what was applied <i>and</i> what the engine would have produced, so the difference is always computable.
Cascade record	Records every derived component that moved as a result — HRA, employer PF, gratuity — and by how much.
Append-only audit	Created, approved, rejected, cancelled and applied are all recorded as rows that are never edited or deleted.

04 Statutory compliance

12 features

Indian payroll statute, computed inside the run.

Provident fund	₹15,000 wage ceiling, 12% employee and 12% employer, employer split into EPS 8.33% and EPF 3.67%, optional contribution above the ceiling, and voluntary PF.
ESI	₹21,000 gross threshold, 0.75% employee and 3.25% employer.
ESI contribution periods	Coverage is fixed for the whole contribution period — 1 April to 30 September and 1 October to 31 March — so somebody who crosses the threshold mid-period stays covered to the end of it.
Professional tax	37 states and union territories resolved. 20 levy it, 17 correctly return zero. Month-aware, including Maharashtra's higher February deduction on the top band only.
Income tax (TDS)	Both old and new regimes, slabs keyed to the financial year, surcharge, 4% health and education cess, and section 87A rebate with marginal relief.
Cumulative TDS	Monthly tax computed on the year to date rather than in isolation, so a mid-year salary change corrects itself over the remaining months.

Gratuity	4.81% monthly provision. Settlement enforces the five-year service floor and the ₹20,00,000 statutory ceiling.
Labour welfare fund	State-wise LWF on each state's own contribution cycle.
HRA exemption	Least of three, with metro and non-metro rates.
NPS	Employer and employee National Pension System contributions as structure components.
Perquisites	Taxable perquisite valuation, recorded per employee and carried into Form 12BA.
Code on Wages	The 50% wage-definition rule assessed against each structure.

Note for marketing. Statutory rates and slabs are stored as data keyed to the period, not hard-coded — so recomputing a closed month applies that month's rules, not today's.

05 Statutory filings & documents

9 features

The documents a payroll team has to produce and submit.

23 documents generated	PF ECR and Full ECR, ESI challan, Form 24Q, PT return, LWF return, Bonus registers C, D and E plus a combined register, Form 16, Form 16 annual, Form 12BA, Form 19, Form 31, Form 1, Form 2, Form 6, Form 124, e-SHRAM, UAN activation, S&E registration and Shram card.
Per legal entity	Filings generate against the entity the employee is actually employed by, using that entity's PAN, TAN, PF and ESI codes.
Batch generation	Generate everything for a period in one action; each document is attempted independently and failures are reported individually rather than aborting the batch.
Pre-filing validation	Checks PAN, TAN, UAN, ESIC and bank details before generating, and reports a filing as not ready rather than writing an invalid placeholder into the file.
Identifier resolution	Statutory identifiers resolve from the employee profile or from the government-ID records, whichever holds them.
Filing calendar	Statutory due dates per document type and period.
Filing status tracking	Each filing carries a status through generated, submitted and acknowledged, with compliance status recorded.
Form 16 distribution	Part A and Part B, generated per employee and released to the portal.

Legal entities

Multiple registered entities under one organisation, each with its own statutory codes, establishment type and exemptions, and its own employees.

Accuracy note. All 23 documents generate ready to upload. Four are preparation sheets rather than statutory returns, and **nothing is submitted automatically** — a person files them.

06 Payments & banking

8 features

Getting the money out, and knowing what happened to it.

Bank transfer batches	A payroll run becomes a payment batch, with per-employee transfer items and a batch-level status.
Bank file formats	NEFT and RTGS upload files in bank-specific formats.
Exclusions, not silent drops	An employee who cannot be paid — missing account, failed validation, payment hold — is returned as a named exclusion rather than quietly omitted from the file.
UTR tracking	The bank's UTR is treated as the only trustworthy payment reference and is recorded against each item.
Payment reversals	Failed or returned payments recorded as reversals against the original transaction.
Stop-payment flags	Hold an individual's payment with a reason and a hold type, so the run completes without paying them.
Reconciliation	Compare what was instructed against what the bank reports, and surface the difference.
Bank detail validation	Account number, IFSC and name validation, plus PAN, Aadhaar, UAN and ESIC format checks.

07 Accounting & finance

7 features

Turning a payroll run into something the finance system accepts.

Payroll journal	A double-entry journal generated from the run. Debits must equal credits to the paisa or nothing is produced.
Unmapped component refusal	A component with no ledger mapping stops the export and is named — never posted to a suspense account, never silently omitted.
Tally export	Tally-format XML voucher, written to Tally's own sign and date conventions.
Zoho Books export	A separate exporter for Zoho Books, rather than one shared path with a flag.

GL mapping	Map each salary component to a ledger account, configured once per organisation.
Cost centres	Allocate payroll cost by cost centre and department.
Burn rate & CTC planning	Monthly payroll cost trend, department budgets and a CTC planner for offers and revisions.

Accuracy note. Accounting exports produce a file for import. There is no live API connection into Tally or Zoho.

08 Payroll controls & audit

9 features

Catching the mistake before the money leaves.

Differences report	Compare any two runs item-wise, employee-wise and consolidated — and see which override caused a component to move.
Negative cost report	Flags employees whose computed cost is negative or implausible.
Duplicate detection	Finds duplicate payments, duplicate bank accounts and duplicate employee records.
Pre-payroll checklist	A gated checklist run before processing — pending approvals, missing bank details, unassigned employees, incomplete profiles.
Approval routing	Configurable approval chains for payroll runs, with recorded approvers and decisions.
Closed-run write guard	A finalised run refuses writes; reopening is an explicit, recorded act.
Per-employee lock	Lock an individual's figures inside an open run so a reprocess cannot change them.
Item versioning	Every payroll item keeps its previous versions, so what changed between processes is recoverable.
Payroll audit log	Every payroll action recorded with actor, time and before/after values, plus a run activity feed.

09 Time tracking & evidence of work

11 features

What people actually did, captured at source.

Desktop tracker	A Windows, macOS and Linux application that records worked time, captures screenshots at a configurable interval, and detects idle at operating-system level.

Offline queue	The tracker keeps working without a connection and uploads from a local queue when it returns — nothing is lost to a dropped network.
Browser extension	A Chromium extension supplying the site and application context behind recorded activity.
Idle rewind	When idle is detected, time rewinds to the last real activity . The idle tail is recorded separately and never counted as worked time.
Idle auto-stop	A server-side sweep closes forgotten timers every minute, because a sleeping laptop cannot close its own.
Productivity classification	Applications and websites classified productive, unproductive or neutral by rules set at organisation level, with a global default set.
Screenshot management	Interval configuration, blur options, per-employee visibility rules and automatic retention purging.
Activity timeline	A chronological feed of applications, websites and sessions per person per day.
Break tracking	Configurable break types, paid and unpaid, tracked against the working day.
Manual time entry	Time added by hand where tracking is not appropriate, with edit requests and approval.
Project & task time	Time attributed to projects and tasks for utilisation and billing analysis.

10 Attendance

10 features

Four ways in, one record.

Biometric terminals	Accepts pushes over ADMS — the protocol eSSL, ZKTeco, Biomax and Matrix devices already speak. Register the device serial and punches arrive.
Device registration & health	Devices must be registered before punches are accepted. The console shows a device that has stopped reporting, and device users not yet claimed by an employee.
Unclaimed punch retention	Punches from an unrecognised device user are kept, not discarded — claiming the ID later attaches the whole backlog.
Replay safety	Punches are unique on device, device user and timestamp, so a repeated push is a no-op.
Mobile punch	Check in and out from the mobile app.
Geofencing	Named zones with a radius; punches recorded with location and flagged when outside the zone.

Attendance selfies	A photograph captured at punch, with a map view of where each was taken.
Regularisation requests	Employees raise corrections to a day; managers approve, reject, or forward to another approver .
Day outcome	Each day resolves to an outcome — present, absent, half day, weekly off, holiday, leave — with the hours behind it.
Team presence	A live view of who is in, who is out and who is on leave today.

11 Shifts & rostering

9 features

Who was supposed to work when.

Shift definitions	Named shifts with start and end times, grace periods, half-day thresholds and overnight handling.
Timezone-aware resolution	Shifts resolve against the employee's own timezone, not the server's.
Shift rotations	Rotation patterns on day-length cycles — a four-on-four-off runs on eight days — with a start offset so a whole team does not rest on the same day.
Roster generation	Generate a roster for a period from a rotation, then adjust individual days by hand.
Draft and publish	A draft roster is invisible to attendance until it is published, so next month can be built without changing what today expects.
Rostered off days	An off day is recorded explicitly , not represented by an absent row — so "told to take the day off" and "nobody scheduled them" stay distinguishable.
Historical integrity	A past roster day is never rewritten; it remains the record attendance for that date was measured against.
Coverage view	Headcount rostered per shift per day, so gaps are visible before they happen.
Shift swaps	A swap needs three parties — the requester, the counterparty's agreement, and a manager's approval — and shifts are re-read at approval rather than trusted from request time.

12 Working-time policies

7 features

The rules that turn hours into pay consequences.

Weekly off policies	Fixed or rotating weekly offs, alternate Saturdays, and per-employee assignment.

Overtime policies	Overtime rates, eligibility, daily and weekly thresholds, and rounding — scopeable to groups rather than applied blanket.
Penalisation policies	Late-arrival and early-departure consequences, including half-day rules, with configurable tolerance.
Shift allowance policies	Allowances for night shift and other qualifying shifts, computed from actual attendance and paid through payroll.
Per-employee assignment	Every policy family has an organisation-level definition and an individual assignment, so exceptions do not require a new policy.
Employee policy visibility	An employee can see which policies apply to them.
Compensatory off	Comp-off earned from working a rest day, held as a balance, with transactions and expiry.

13 Labour-law compliance

6 features

The Factories Act and state Shops & Establishments Acts, assessed.

Statutory working-hour limits	Daily and weekly hour ceilings, spread-over limits and rest-interval requirements, held as properties of the legal entity and its establishment type — not as a policy somebody configured.
Provision citation	Each limit carries the section it comes from, so a state amendment changes one place.
Exemptions read, not inferred	Where an Act allows a relaxation only by written order of an inspector, the exemption is read from the entity record and never assumed from its address.
Statutory overtime register	Overtime measured against the statutory threshold — excess over nine hours a day or forty-eight a week — which is a different measure from overtime against the rostered shift.
Overtime floor check	A configured overtime rate below the statutory minimum is always flagged, and paid at the floor only where the entity is set to enforce it.
Breach report	Working-hour breaches per employee per period. Where an establishment is unassessed, it reports as unassessed rather than compliant .

14 Leave management

10 features

Entitlement, balance and consumption.

Leave types	Unlimited types, each with its own annual quota, paid or unpaid treatment and approval requirement.

Accrual	Monthly, quarterly, half-yearly or annual accrual per type, applied automatically on schedule.
Joiner pro-rating	Mid-year joiners accrue proportionally, against a configurable cut-off day that decides whether a joining month counts.
Probation rates	A separate accrual rate during probation, and notice-period handling that takes precedence over it.
Ledger-based balances	A balance is the sum of dated ledger rows , not a stored counter — so a disputed balance expands into the transactions that produced it.
Year end	Three outcomes per type — carry forward up to a cap with the excess expiring, reset to zero, or encash — each written as its own ledger row.
Encashment	Approved encashment creates a payroll liability the next run picks up.
Requests & approval	Apply, approve, reject, revoke, and forward to another approver, with escalation on delay.
Half-day & partial	Half-day leave and partial-day consumption supported.
Holiday calendars	Organisation and location holiday lists, applied to attendance and leave.

15 Employee records

9 features

The master record everything else hangs off.

Employee profile	Personal details, contact, emergency contact, address, date of birth, gender, marital status and photograph.
Work information	Designation, department, team, location, employment type, joining date, confirmation date, reporting manager and probation status.
Government IDs	PAN, Aadhaar, UAN, ESIC and passport, each with a proof document and format validation.
Bank accounts	Salary account with IFSC, account type and a proof document, validated before payment.
Documents	Categorised document store per employee with review status and expiry tracking.
Education & history	Qualifications and previous employment records.
Organisation chart	Reporting structure rendered as a navigable tree, resolved from reporting-manager relationships.
Departments & teams	Department and team structures with heads and members.

Custom fields

Additional fields defined per organisation and captured on the employee record.

16 Onboarding & exits

10 features

The first ninety days and the last thirty.

Onboarding journeys	A structured joining plan with up to 18 steps spanning day -14 to day +90 , opened automatically when a joining date is set.
Owned steps	Each step has an owner role — HR, IT, finance, manager, buddy or the joiner — so nothing sits unassigned.
Blocking gates	Steps that must complete before the next stage, including payroll readiness before the first run.
Self-service completion	A joiner completes only their own items, from the portal or the mobile app.
Document matching	Uploaded documents automatically satisfy the checklist items they correspond to.
Resignation	Employee-initiated resignation with notice calculation, manager and HR approval, escalation, withdrawal and status visibility.
Exit process	The process after approval, and the only route for terminations, retirements and redundancies — with a clearance checklist, access revocation and a recorded last working day.
Exit interview	A structured interview captured against the exit.
Rehire eligibility	Recorded at exit, and checked if the person is considered again.
Full & final settlement	Final dues, notice recovery, leave encashment, gratuity, loan recovery and pending reimbursements, computed together and paid through a settlement run.

17 Employee self-service

8 features

What the employee can do without asking HR.

Payslips	View and download current and historical payslips, with the component breakdown behind each figure.
Salary breakdown	The full CTC structure — earnings, deductions, employer contributions — with the statutory notes that explain each.
Leave balance & requests	Balance per type with the ledger behind it, plus apply, track and cancel.

Attendance & regularisation	Own attendance record, and requests to correct a day.
Tax declarations	Submit investment declarations and upload proofs.
Reimbursement claims	Raise claims with receipts and track approval.
Profile self-update	Update personal details, contact, bank and documents, subject to review where required.
Salary revision letters	Receive a revision letter and formally accept or reject it.

18 Income tax & proofs

7 features

Declaration season, handled.

Investment declarations	Section-wise declarations submitted by employees and reviewed by payroll, feeding straight into TDS.
Proof submission	Document upload against each declared item, with per-item review status.
Bulk proof approval	Review and approve proofs in bulk rather than one at a time.
Form 12BB	Generated from the declaration and proof record.
Regime comparison	Old versus new regime computed side by side for each employee's actual figures.
Tax simulator	Model the effect of a declaration, a salary change or a regime switch before committing to it.
Saving recommendations	Suggested deductions based on the employee's current declared position.

19 Expenses, benefits & advances

8 features

Everything else that reaches a payslip.

Reimbursements	Claims with receipts, category limits, two-stage approval — manager then finance — and payment through payroll or separately.
Flexible benefit plan	FBP components declared by the employee within an allocated envelope, claimed against proofs, and reflected in tax.
Employee loans	Loan issuance with interest, tenure and instalment schedule, recovered automatically through payroll and closed on settlement.
Salary advances	Advance against salary, recovered in later runs.

Variable pay	Rules and per-employee assignments for incentive and variable components, computed and released through the run.
Perquisite records	Company car, accommodation and other perquisites recorded and valued for tax.
Garnishments	Court-ordered and statutory deductions applied with priority handling.
Compensation revisions	Effective-dated salary changes. A mid-month revision blends correctly across the month, and a back-dated one produces exact arrears against the rate that was actually in force.

20 Recruitment

11 features

Requisition to joining date.

Job openings	Requisitions with department, location, headcount, salary band and status.
Candidates and applications	A candidate is a person; an application is one candidacy. The same person can apply for two roles without their history being overwritten.
Hiring pipeline	Configurable stages, with every move recorded as a dated event. Moving backwards is allowed and recorded as such.
Rejection context	A rejection keeps the stage it happened at — "rejected after the technical round" and "rejected on the CV" stay different facts.
Interview scheduling	Interviews with panels, scheduled against candidates and stages.
Panel feedback	Feedback recorded per interviewer and never averaged , with an explicit split indicator so a two-to-one disagreement is visible rather than hidden in a mean.
Panel progress	Invited and submitted tracked separately, so "two of three have responded" is answerable.
Offer management	A state machine from draft through approval, sending, and acceptance or decline. Approvers are recorded when asked, not only when they answer.
Offer revision	Once a candidate has seen an offer the terms cannot be edited in place — a revision is a new offer superseding the old.
Offer e-signing	The candidate opens a secure link, reads the letter, types their name and accepts or declines. No account required. Declining is offered on the same page.
Background verification	Consent recorded against a specific scope of checks, with findings graded clear, discrepancy or insufficient, adverse-action notices, and a candidate right of response.

Accuracy note. There is no public careers page — candidates are added by the hiring team. Background checks are recorded by a person; there is no verification-vendor integration.

21 Performance

6 features

Review cycles	Named cycles with periods, participants and stages.
Goals & OKRs	Goals with owners, targets, weightings and progress, cascaded through the reporting structure.
Check-ins	Periodic progress updates recorded against a goal.
Competencies	A competency framework with per-competency ratings inside a review.
360 feedback	Self, manager, peer and reportee inputs aggregated into one review.
Review outcomes	Ratings and outcomes recorded and available to compensation planning.

22 Work management

8 features

Projects	Projects with members, budgets, hourly rates and time attribution.
Tasks	Assignees, priorities, due dates, estimates, statuses including in-review, and time logged against each.
Task structure	Dependencies, checklists, labels, watchers, comments, attachments and an activity history.
Recurring tasks	Tasks that regenerate on a schedule.
Chat	One-to-one and group messaging with reactions, attachments, thumbnails, typing indicators and read state.
Large file sharing	Resumable chunked uploads for files too large for a single request.
Polls	Team polls with options and vote tracking.
Assets	Company asset register with assignment to employees, and return tracking on exit.

Accuracy note. Chat delivers by polling rather than a live socket connection. Do not describe it as real-time.

23 Reports & analytics

10 features

Time reports	Daily, weekly and monthly worked time per person, team and project.
---------------------	---

Productivity reports	Productive, unproductive and neutral time, application and website usage.
Attendance reports	Presence, absence, late arrivals, early departures and overtime by period.
Payroll register	Full component-wise register for a run, per employee and consolidated.
Statutory registers	PF, ESI, PT, TDS and LWF registers for a period.
Headcount movement	Joiners, leavers and running headcount by month, aggregated server-side so people who have since left are still counted.
Attrition	Exit analysis by reason, department and period.
Cost analytics	Payroll cost trend, department budgets, cost per head and burn rate.
Custom reports	Saved report definitions with chosen fields and filters.
CSV export	Every report exports for use elsewhere.

24 AI assistant

6 features

Asking the system questions in plain English.

Ask your data	Type a question — "who was absent more than three days last month", "average net pay by department", "top five departments by gross in July" — and get a real answer computed over your own records, as a table.
Broad coverage	Roughly 149 data entities are askable, derived from the database itself rather than a hand-written list of supported questions.
Answers explain themselves	Each answer carries notes stating how the figure was defined, what period it covers, and how many rows it included — so a number can be checked rather than trusted.
Refuses rather than guesses	A question it cannot answer is refused with the reason, and an empty result is reported as empty — never as zero.
Assisted changes	Instructions can change a small set of settings — leave-type quotas, organisation settings, department names — always through a preview showing the exact before and after, confirmed by a person before anything is written.
Global search	Cross-entity search from anywhere in the application, with an AI mode alongside it.

25 Security & access

10 features

--	--

Data isolation	Every organisation's data is separated at the database-access layer across 143 record types, with an automated test that fails the build if a new record type is added without it.
Two-factor authentication	TOTP with recovery codes, an organisation-wide policy of off, grace or enforced, grace deadlines, and mandatory enrolment for privileged roles.
Single sign-on	SAML 2.0 with any standard identity provider. A new connection is created switched off, so enabling it is a deliberate second act.
Directory provisioning	SCIM 2.0 user provisioning from Microsoft Entra or Okta. Deactivating a leaver revokes their access tokens , not just a flag, and a directory delete deactivates rather than erases payroll history.
Roles & permissions	Built-in and custom roles, granular permissions, group-based access, and route-level enforcement covered by tests.
Break-glass access	Emergency elevation recorded as a time-boxed session with a reason, rather than a permanent permission grant.
Audit logging	Platform-wide audit trail of who did what and when, with payroll changes held append-only.
Monitoring consent	Every capture path passes a consent gate. Notices are versioned and never edited, consent is per capture type and withdrawable, and capture is refused once consent lapses — built around DPDP obligations sitting with the employer.
Screenshot retention	Automatic purging after a configured retention period.
Login protection	Rate limiting on login and verification, session management, device labelling and forced password reset.

Accuracy note. There is no SOC 2 report or ISO 27001 certificate at present, and no published uptime commitment. Describe the controls, not a certification.

26 Integrations & API

6 features

REST API	Every action in the product is available over a documented REST API — nothing is locked to the user interface.
API clients & tokens	Named API clients with scoped, revocable tokens.
Webhooks	Registered endpoints with per-event subscriptions and a delivery record per attempt.
Accounting exports	Tally XML and Zoho Books file exports.
Biometric protocol	Native ADMS support for eSSL, ZKTeco, Biomax and Matrix terminals.

Bank formats

Bank-specific NEFT and RTGS file formats.

27 Administration

8 features

Organisation settings	Company profile, timezone, working days, office hours, late thresholds and payroll defaults.
Invitations	Invite by email or shareable link, bulk CSV import, resend, revoke and expiry.
Approval inbox	One place for everything awaiting the current user — leave, regularisation, reimbursement, resignation, offers, overrides and payroll.
Notifications	In-app and email notifications with a notification centre, plus mobile push.
Subscription & billing	Plans, seat limits enforced at the point of invitation, billing cycles, online payment and invoices.
Support	In-app support with a help drawer and contextual guidance.
Multi-organisation console	A platform-level console for managing organisations, plans, users and billing across tenants.
Audit log viewer	Searchable audit history for administrators.

28 Applications

4 apps

Four clients against one platform.

Web application

The full product — 133 screens covering payroll, attendance, people, hiring, reports and administration.

Mobile app

iOS and Android. Punch in and out, leave, payslips, approvals, profile and notifications.

Desktop tracker

Windows, macOS and Linux. Worked time, screenshots, idle detection and an offline queue.

Browser extension

Chromium. Supplies site and application context for activity classification.

Every feature listed is present in the codebase and reachable in the product. Accuracy notes mark the four places where a reasonable reader might assume more than is built — filings are generated but not submitted, accounting exports a file rather than pushing to an API, chat polls rather than streams, and no security certification is held. Figures were counted against the working tree, not quoted from earlier documents.
