

What the product does

Written in the order the work actually happens — from someone starting their day, through to the salary reaching their bank and the return reaching the department. Plain language, no technical terms.

THE WHOLE THING IN SIX STEPS

1

**Work is
recorded**

2

**It becomes
attendance**

3

Payroll is run

4

Salary is paid

5

**Returns are
filed**

6

**Books are
updated**

Most companies use a different tool for each of these and copy numbers between them once a month. Here it is one system, so the hours a person worked and the salary they are paid are the same record — not two records someone hopes agree.

Recording the work

Everything starts here. There are four ways for work to get recorded, and a company can use one or all of them. Whichever is used, it ends up in the same place.

The desktop app

Installed on a laptop or desktop. Works on Windows, Mac and Linux.

Time tracking	A person clicks start when they begin work and stop when they finish. The time is saved against a project and task if one is chosen.
Dual timers	A second job can be timed alongside the main one without stopping it.
Offline mode	If the connection drops, the app keeps recording and uploads later. It saves the time the person actually clicked, not the time it reached the server, so the hours land in the right month.
Screenshot capture	Taken automatically while the timer runs, at an interval the company sets.
Idle detection	If there is no typing or mouse movement for five minutes, the timer stops itself — and it backdates the stop to the last real activity , so the idle gap is never counted as work.
Idle notification	An email goes out when idle time stops someone's timer, so they find out immediately rather than at the end of the day.
Server-side idle sweep	If the laptop is closed or the app dies, the system still closes the timer using the same rule. A sleeping laptop cannot leave a timer running all night.
Idle resolution policy	A phone call or reading a document looks like idle time. The company chooses one of three rules: always count it, never count it, or ask the person to decide. Only the person it belongs to can decide — a manager cannot answer for them.

The browser add-on

URL & application capture	A small add-on for Chrome records which websites were open, so the activity list shows the site rather than just "browser".
Credential redaction	Anything after a question mark in a web address is removed before anyone can see it, because that is where login links and one-time codes hide. This applies when the record is displayed , so it also protects records captured before the rule existed.

Biometric machines

The fingerprint and face machines already on the wall.

Biometric integration (ADMS)	Speaks the same language as eSSL, ZKTeco, Biomax and Matrix devices. The machine sends punches in by itself — no software to install on a PC in the office.
Device registration	Punches from an unknown machine are not accepted, so nobody can send in fake attendance.
Unclaimed punch retention	If a machine sends a punch for an ID nobody has claimed yet, it is stored rather than thrown away. When someone claims that ID, the whole history attaches to them.
Device health monitoring	The settings screen shows any device that used to report and has stopped — the failure that otherwise goes unnoticed until payroll day.

Worth knowing. The machine has to be able to reach the internet. A device that only works over a local office network, or one that needs its own software to pull data out, will not connect.

The mobile app

For field staff, drivers, site teams and anyone not at a desk.

Mobile punch-in	Check in and out from anywhere.
Geofencing	Draw a circle on a map around an office or site. A punch from outside it is refused, or flagged, depending on the setting.
Attendance selfie	A selfie is taken when the person punches, with a map view showing where each one was taken.

Privacy is built in. Nothing is recorded without the person agreeing to it first — screenshots, activity and location each need their own separate consent, and any of them can be withdrawn later. If someone has not agreed to location, they can still punch in; only the location is left off. Attendance is never blocked over a privacy setting.

What the recorded work shows

Activity timeline	Which apps and websites were used, in order, with how long each lasted.
Productivity classification	The company decides which apps and websites count as productive, unproductive or neutral. Anything not yet decided counts as neutral.
Retrospective reclassification	Mark a website unproductive today and last month's reports are recalculated too, so old and new reports agree.
Bulk classification	Up to 100 apps or sites in one action.

Timezone-aware reporting	Times are shown in each person's own time zone, with the zone named — so a 9am start in Manila does not appear as 5:30am to someone in Mumbai with no explanation.
Break tracking	Break types are set up by the company — paid or unpaid, with a daily limit if wanted. Break time is never counted as work.
Screenshot access control	A manager sees only their own team, and never anyone senior to them. A screenshot link cannot be forwarded to someone else — it stops working for anyone but the person it was made for.
Linked time deduction	Where a company lets people delete their own screenshots, the tracked time that screenshot covered is deducted too. Otherwise deleting the evidence and keeping the pay would be possible.

Attendance, shifts and leave

Recorded work is measured against what the person was supposed to work.

That is what turns hours into a day marked present, half day, absent or on leave

— and it is what payroll reads.

Attendance

Auto check-in	Someone who forgets to press check in is still marked present the moment they start working.
Late-mark threshold	The company sets the cut-off, 10:30am by default. Arriving early records zero minutes late — never credit.
Multiple punch pairs	The day is made of separate punches which add up to the day's total, so lunch and site visits are handled properly.
Live attendance dashboard	One screen showing who is in, who is out, who is on leave, and who is finishing soon.
Attendance calendar & register	A month at a glance per person, and a summary across any date range up to 90 days.
Attendance regularisation	If tracking missed real work, the person asks for time to be added — between 10 minutes and 10 hours, with a note. Only one open request per day.
Holiday validation	Checked against the company holiday list.
Approval forwarding	An approver who is not the right person can forward it up the chain or to a named colleague. The full history of who passed it where is kept.
Locked-period guard	Once payroll for a month is finished, corrections for that month are refused with a clear message rather than quietly changing figures that were already paid.

Shifts and the rota

Shift master	Name, timing, length, unpaid break, and how many minutes of lateness are allowed before it counts.
Night-shift detection	A 10pm to 6am shift is treated as a night shift whether or not anyone ticked the box, because the night allowance depends on it.
Shift-based overtime	Someone on a six-hour shift earns overtime after six hours, not after eight.
Shift rotation	Set up a cycle such as four days on, four days off. Each person can start at a different point in the cycle so the whole team does not rest on the same day.

Build next month's rota without affecting today	A rota stays as a draft that only the manager can see until it is published. Attendance ignores drafts entirely.
Explicit weekly off	"Told to take the day off" and "nobody scheduled them" stay different facts, which matters when someone asks why they were marked absent.
Last month's rota is never rewritten	It stays as the record every attendance day was measured against.
Non-destructive generation	Days a manager set by hand are skipped and reported back, so regenerating never wipes a decision someone made.
Shift swap workflow	The person asking, the colleague accepting, and a manager approving. Shifts are re-checked at approval rather than trusted from when the request was made.

Leave

Leave application	A date range, full day or half day, a leave type and a reason.
Balance validation	Weekends are not counted, half days count as half, and a request beyond the balance is refused — telling the person exactly how much they have and how much they asked for.
Overlap detection	Nobody can accidentally book the same days twice.
Leave type master	Each with its own yearly quota, and whether it is paid.
Leave accrual	Monthly, quarterly, half-yearly or yearly — whichever the company uses. Someone joining in August gets a fair part-year amount rather than the full year.
Probation & notice rules	And a separate rule during notice period.
Leave ledger	A balance is not a stored number. It is the sum of dated entries, so "why is my balance 8.5?" opens into the rows that produced it rather than ending in an argument.
Year-end processing	Carry forward up to a limit with the rest lapsing, reset to zero, or pay it out. Each is recorded as its own entry so "10 carried, 5 lapsed" can be said properly.
Leave cancellation	Allowed up to one day before it starts. Approving the cancellation removes the absent days again — but only days where nobody actually worked, so real work is never deleted.
Worked-day protection	If someone actually clocked in on a day covered by approved leave, that day is left as worked.
Compensatory off (comp-off)	Earned by working a rest day, held as a balance, with expiry.
Holiday calendar	Per company and per location, applied to both attendance and leave.

Working-time policies

The rules that decide what an hour is worth. Set once for the company, adjustable per person.

Weekly off policy	Fixed or rotating weekly offs, and alternate Saturdays.
Overtime policy	The rate, who is eligible, the daily and weekly thresholds, and how it rounds. Can apply to a chosen group rather than everybody.
Late-mark & penalisation policy	What happens after repeated late arrivals or early departures, including half-day rules and how much lateness is tolerated first.
Shift allowance policy	Night-shift and other allowances, worked out from actual attendance and paid through payroll rather than added by hand.
Per-employee assignment	Every policy has a company-level setting and an individual assignment, so one exception does not mean creating a whole new policy.
Employees can see their own policy	So “why was I marked half day” has an answer they can read themselves.

Labour-law compliance

The Factories Act and state Shops & Establishments Acts, checked automatically.

Statutory working-hour limits	Daily and weekly hour ceilings, spread-over limits and rest-break requirements — held against the registered establishment and its type, not as a policy somebody typed in.
Statutory overtime register	Overtime measured against the legal threshold — over nine hours a day or forty-eight a week — which is a different figure from overtime against the rostered shift, and the one an inspector asks for.
Overtime rate floor	If the configured overtime rate is below the statutory minimum, it is flagged.
Breach report	Working-hour breaches per person per period. Where an establishment has not been assessed, it says unassessed rather than showing a green tick that means nothing.
Exemptions are recorded, not assumed	Where a relaxation is only legal with a written order from an inspector, it has to be recorded against the establishment — never guessed from its address.

Running payroll

The hours from Part 1 and the attendance from Part 2 come into the payroll run without anyone exporting or re-typing anything. This is the part that most companies do in a spreadsheet.

The monthly run

Bulk payroll processing	Picks the month, calculates every employee with a salary set, and produces the bank file. Anyone without a salary is skipped and listed back to you by name rather than silently left out.
Selective processing	Useful for a late joiner or a correction, without touching anyone else.
Attendance sync	Attendance, leave, unpaid days and overtime come into the run in one action.
Processing progress	A progress bar showing done, failed and skipped counts while a large payroll processes in the background.
Concurrency lock	A second attempt while one is already running is refused, so nobody gets paid twice.
Payroll run lifecycle	Draft, locked, approved, released, paid — each one recording who did it and when.
Maker-checker approval	The person who locks the run cannot approve it, and the person who approves cannot release it. Switches on automatically once a company has three or more admins.
Mandatory unlock reason	Written down, attached to the run with the person's name, and kept permanently.
Individual reprocessing	Undo a single employee's pay so it can be recalculated. Any loan instalment it took is added back to their loan balance automatically.
Period closure	Once salary has gone out, that month cannot be re-processed or edited. It is the record of what was actually paid.

Checks before the money moves

Pre-payroll checklist	Leave and attendance, joiners and leavers, bonus and revisions, reimbursements, holds and arrears, and overrides — each showing live counts such as "18 of 20 employees have attendance finalised".
Joiner & leaver review	Who joined, who left, and any final settlements outstanding — with a decision per person: pay normally, hold the calculation, hold only the payment, or leave out.
Stop-payment flag	Hold a single person's pay with a reason, either "do not calculate" or "calculate but do not pay".

Differences report	Shows every figure that moved between two runs, per person and per component — the fastest way to catch a mistake before it is paid.
Exception reports	Negative pay, duplicate payments, duplicate bank accounts and duplicate employee records are all flagged.
Signed net pay	If deductions exceed earnings, the figure shows as negative rather than being rounded up to zero — so the problem is visible before payday.
Payroll audit trail	Every action with who did it, when, and from where.

Salary structures

Salary structure master	Basic and HRA as percentages, plus fixed amounts for conveyance, meals, internet, transport, uniform, education, books and fuel. Add your own components too.
CTC breakup preview	Type any CTC and see the full monthly breakdown it would produce, before assigning it to anybody.
CTC range bands	A junior and a senior on the same template can still get appropriate splits.
Unassigned employee report	A screen showing everyone not yet in a pay group.
Formula-based components	For anything unusual — such as a bonus that only applies above a salary threshold. Formulas are checked before they can be saved.

Pay groups

The single most useful thing to set up first. A pay group holds everyone who is paid the same way, so settings are made once rather than per person.

Create a pay group	A name and a short code, a pay frequency of monthly, fortnightly or weekly , and the pay day — either a fixed date of the month, the last working day, or the last calendar day.
Statutory settings per group	Switch PF, ESI, professional tax, labour welfare fund and TDS on or off for the group. The change flows down to every employee in it automatically — you do not touch them one by one.
A salary structure per group	Link the structure the group uses, so a new joiner added to the group is set up correctly the moment they arrive.
State-wise registration details	Each group holds its own professional tax establishment number, labour welfare fund number, PF registration and code, and ESI registration — recorded per state, which is what makes returns correct for a company operating in more than one.
Create a group and fill it in one go	Name the group, pick the employees, and both happen together. The short code is generated for you and made unique automatically.

Move people between groups	Select a batch and move them, optionally applying the new group's salary structure at the same time.
One group at a time, with full history	A person belongs to exactly one pay group. Moving them closes the previous membership with an end date rather than overwriting it, so you can always see which group somebody was in when a past month was paid.
Find who is not in a group	A screen listing everyone not yet assigned, with their department, joining date and salary — so nobody is discovered missing on payroll day.
Search while you build	Search the whole employee list by name, email or designation, and filter by department, while choosing who goes in.
Department-level defaults	Payroll settings can also be defaulted per department, inherited by anyone in it unless set otherwise for that person.

Why this matters. A company with an office in Maharashtra and one in Karnataka has different professional tax and different registrations. Pay groups are how that is handled once, correctly, instead of remembered every month.

Changing one person's salary

Component override	Override what the structure would calculate for basic or HRA, for one person, from a chosen date.
Impact preview	Raising basic by ₹1 takes about ₹1.67 out of the balancing allowance, because HRA, employer PF and gratuity all move with it. You see this before you save, not after.
Validation at entry	And the message tells you the largest amount that would work — rather than accepting it and failing on payroll day.
Bulk override grid	All employees in one table. Edit several, update in one action.
CSV import & export	Export, edit in Excel, upload back. Errors are reported per row with the spreadsheet row number , what is wrong, and how to fix it — and nothing is saved until they are cleared.
Override approval workflow	One person proposes, another approves. Nobody can approve a change to their own pay.
Override audit register	Every change keeps what was applied and what the system would have calculated, so the difference can always be explained.

Statutory deductions

Calculated inside the run, not worked out separately.

DEDUCTION	WHAT IS HANDLED
PF	The ₹15,000 wage limit, 12% from the employee and 12% from the employer, the employer's share split correctly between pension and PF, contribution above the limit where chosen, and voluntary PF.
ESI	The ₹21,000 threshold at 0.75% and 3.25%. Coverage is held for the whole half-year period — April to September, October to March — so someone who gets a raise mid-period keeps contributing until it ends, which is the rule most systems get wrong.
Professional tax	All 37 states and union territories. 20 charge it, 17 correctly charge nothing. It also knows about special months, such as Maharashtra's higher February deduction.
Income tax	Old and new regime, current slabs, surcharge, cess and the rebate. Worked out on the year to date, so a mid-year salary change corrects itself over the remaining months instead of arriving as a shock in March.
Gratuity	Provisioned monthly. At settlement the five-year rule and the ₹20,00,000 ceiling are both applied.
Labour welfare fund	State by state, on each state's own cycle.
Unpaid leave	Divided by calendar days, so one absent day costs at most one thirtieth of the month — never one twenty-second. PF, ESI and professional tax are then charged on what was actually earned.
Overtime	Paid at double the normal hourly rate.

When the rules change. Rates and slabs are stored by period rather than built into the software. Re-running an old month applies **that month's** rules, not today's — which is what makes a recalculation trustworthy.

Paying people and filing returns

Getting the money out

Bank transfer file (NEFT/RTGS)	Produced in your bank's format with names, accounts, IFSC codes, amounts and a total. Only available once the run has been approved.
Payment exclusions	Anyone who cannot be paid is left out of the file and returned to you by name , with exactly which detail is missing, so they can be paid another way.
Disbursement confirmation	Marks every payslip paid and freezes the month. People who genuinely could not be paid are not silently marked as paid.
The bank's own reference is kept	So a payment on a statement can be matched to a payslip. Where no reference exists the field is left empty rather than filled with an invented code.
Off-cycle payment	For a payment made by cash or outside the bank run, with its own reference.
Payment reversal	Admin only, with a written reason, creating a reversal against every paid payslip.

Payslips

Bulk payslip generation	Anyone who already has one is skipped rather than duplicated, and one badly-set-up employee cannot break the whole batch.
Payslip distribution	Every employee gets a notification and an email with the PDF attached the moment the run is paid.
Payslip history & YTD	Every payslip they have ever had, with earnings, each deduction, days worked, hours, and running year-to-date totals.
Payslip versioning	If a payslip was corrected and the new PDF is not ready, the employee is told that plainly instead of being handed the old, wrong figure.
Nobody sees anyone else's	An employee can only ever open their own.

Statutory returns

Statutory filing generation	PF ECR file, ESI challan, Form 24Q, professional tax and labour welfare fund returns, bonus registers, Form 16, Form 12BA and more — ready to upload to the department portal.
Pre-filing validation	PAN, TAN and UAN are validated first. A document reports as not ready rather than being produced with an invalid number in it.

Multi-entity filing	Each registered entity has its own PAN, TAN, PF and ESI numbers, and returns are produced separately for each.
Compliance calendar	PF and ESI by the 15th, professional tax by the 20th, TDS by the 7th — with a countdown and a warning when a deadline is close.

Worth knowing. The documents are produced ready to submit, but **a person still uploads them** to the department portal. Nothing is filed automatically. Four of the 23 are preparation sheets rather than returns.

Updating the books

Payroll journal (Tally / Zoho)	The payroll run becomes a journal entry for Tally or Zoho Books, so nobody types salary figures into the accounts by hand.
Balanced-journal enforcement	Debits must equal credits exactly. A payroll component with no ledger account assigned stops the export and is named — never quietly dropped or dumped into a suspense account.
GL mapping & cost centres	Salary cost split by department and cost centre, with budgets and a monthly trend.

Worth knowing. This produces a file you import into Tally or Zoho. It does not connect to them directly.

Employee records and joining

The employee record

Employee master	Personal details, address, emergency contact, job details, department, designation, reporting manager, joining date and employment status.
Statutory IDs & documents	PAN, Aadhaar, UAN, ESIC and bank details, each with the proof document attached. Numbers are format-checked before saving , so a wrong PAN is refused rather than discovered on filing day.
Data masking	A list shows whether a PAN is on file, not the number itself. Bank account numbers are masked to the last four digits.
Document visibility control	Documents are private by default — an offer letter and a warning letter sit on the same record, so sharing is always a deliberate choice. Anything the employee uploaded themselves is always visible to them.
Reporting hierarchy	A reporting loop is refused, and a manager must actually be senior to the person reporting to them.
Org chart	Everyone can see who reports to whom — with no salary, no ID numbers and no personal details in it.
Employee 360 view	One screen with their attendance summary, leave taken, whether they are working right now and on what, recent time entries, project breakdown, recent payslips and pending requests.
Employee export	The employee list as a spreadsheet, filtered however you need.

Joining

Onboarding journey	Created automatically when an employee is added, however they were added.
Pre-boarding to day 90	Steps run from two weeks before the start date to three months after, because several things need doing before someone arrives.
Task ownership	HR, IT, finance, the manager, a buddy, or the joiner themselves — so nothing sits unassigned.
Employee self-onboarding	They see only their own items. "IT has not ordered your laptop" is not their problem, so it is not shown to them.
Evidence-backed completion	Upload the PAN card and "add PAN details" completes itself. It cannot be ticked by hand , because a hand-ticked box would claim a document exists that payroll would later find missing.
Payroll readiness gate	Before the first salary run, so a new joiner is never missed or paid wrongly.

Leaving

Resignation workflow	Raised by the employee, with notice period worked out, manager and HR approval, and the option to withdraw.
Exit & clearance	Clearance checklist, access removal, last working day and an exit interview. Also the route for terminations and retirements.
Full & final settlement (F&F)	Notice shortfall recovery, leave encashment, gratuity, part-month salary and any outstanding loan — worked out together and paid as one settlement.
Rehire eligibility	Recorded at exit and checked if the person is ever considered again.
Attrition analytics	Who left, when, why, and from which department.

What employees do themselves

Work that would otherwise land on HR.

Payslips & CTC breakup	Current and past payslips, and the full explanation of their CTC.
Leave self-service	Including the entries behind the balance.
Regularisation request	Rather than emailing HR about a missed punch.
Investment declaration & proofs	Submit investment declarations and upload the proof documents.
Expense claim	With a receipt photo from the phone.
Profile self-update	Address, phone, bank and documents. Their own submissions are always marked pending review — nobody is their own verifier .
Salary revision letter	Formally accepted or rejected by the employee, on record.

Income tax help

Old regime or new — which is better	Compared side by side on the person's real salary, showing the rupee difference and which to choose.
Tax saving recommendations	Remaining room under 80C, NPS, health insurance and home loan interest — each showing the tax it would actually save, biggest first.
HRA exemption calculator	Enter the rent paid and see the exemption and the tax it saves.
Bulk regime switch	Move a group of employees between regimes in one action.
Bulk proof approval & Form 12BB	Approve many at once instead of one at a time. Form 12BB is produced from what was approved.

Money beyond salary

Reimbursement management	Submitted with a receipt, approved first by the manager and then by finance, and paid with the next salary. Nobody approves their own — a manager's own claim goes straight to the admin queue.
Two-stage approval	With unread counts, search, and bulk approve or reject.
Employee loans & advances	Requested with an amount and a number of instalments up to 60. Once approved, instalments come out of salary automatically and the loan closes itself when fully repaid.
Self-approval block	The person is told to ask another approver.
Flexible Benefit Plan (FBP)	Employees choose components within an allowance, claim against proofs, and the tax effect is applied.
Arrear processing	For a back-dated increase. The difference is worked out against the salary that was actually in force on each affected day, and the tax on it is the difference between the old and new position — not a fresh charge.
Leave encashment	Days converted to money at the correct daily rate, checked against the balance, and paid through payroll.
Variable pay	Rules set once and applied per person through the run.

Hiring

Requisitions & candidate database	A candidate is a person and an application is one attempt at one role, so someone good who applies for a second role keeps their history.
Hiring pipeline	Your own stages, with every move recorded and dated. Moving someone back a stage is allowed and recorded as such.
Stage-aware rejection	"Rejected after the technical round" and "rejected on the CV" stay different facts.
Interview panel feedback	Feedback is recorded per interviewer and never averaged . Three people split two-to-one and three people all lukewarm produce the same average but need completely different conversations.
Panel progress tracking	Invited and submitted are tracked separately, so "two of three have responded" is answerable.
Offer approval workflow	Draft, approval chain, sent, accepted or declined. Approvers are recorded when they are asked , not only when they answer.
Offer e-signing	They open a secure link, read the letter, type their name and accept or decline. No account to create — asking a candidate to register loses offers.
Offer revision control	Once a candidate has seen an offer, a change is a new offer replacing the old one.
Background verification (BGV)	Consent is recorded against a specific list of checks — agreeing to employment verification is not agreeing to a credit check. Findings are recorded as clear, discrepancy or insufficient, never as pass or fail.
Offer-to-onboarding handoff	So headcount and the offer cannot disagree, and joining formalities start straight away.

Worth knowing. There is no public careers page — candidates are added by your hiring team. Background check findings are recorded by a person; there is no connection to a verification agency.

Reports and day-to-day work

Reports

Time & productivity reports	Hours worked by person, team and project. Productive versus unproductive time. Which apps and websites were used.
Attendance reports	Present, absent, late, early leaving and overtime across any period.
Payroll & statutory registers	The full salary register for a month, plus separate PF, ESI, professional tax and income tax registers.
Headcount & movement analytics	Joiners, leavers and running headcount month by month — counted properly, including people who have since left.
Cost analytics	Salary cost trend, cost per head, department budgets and burn rate.
Export to Excel	Any report to Excel.
Payroll dashboard	Alerts for missing bank details and PANs, headline totals with month-on-month arrows, the six-stage progress tracker, and the compliance countdown.

Ask a question in plain English

Natural-language querying	"Who was absent more than three days last month", "average salary by department", "top five departments by salary cost in July" — answered as a table from your own records, without building a report.
Explainable results	Each answer says how the figure was worked out, what period it covers and how many records it used — so it can be checked rather than trusted.
Refusal handling	A question it cannot answer is refused with the reason. An empty result is reported as empty, never as zero — those are different facts.
Global search	One search box that finds people, projects, tasks and records from anywhere in the system.

Work management

Project & task management	With owners, due dates, priorities, checklists, dependencies and comments — and time logged against each.
Recurring tasks	Tasks that create themselves on a schedule.
Internal messaging	One-to-one and group chat with file sharing, including large files.

Asset management	Laptops, phones and equipment assigned to people, with return tracked at exit.
Performance management	Review cycles, goals with progress check-ins, a competency framework, and feedback gathered from self, manager and peers.
Unified approval inbox	Everything waiting on a person — leave, attendance corrections, expenses, resignations, offers and payroll — in a single place.

Worth knowing. Chat checks for new messages every few seconds rather than delivering them instantly. It works well, but it is not a live chat app.

Who can see what

Salary data is the most sensitive thing a company holds. Right now, in most small companies, it sits in a spreadsheet that anyone with the file can open. Here, what each person can reach is decided by their level.

LEVEL	WHAT THEY CAN REACH
Admin	Everything in the company — settings, all employees, all salary, all reports, and who else gets which role.
HR / Payroll	Runs payroll and sees everybody's pay, but cannot change company settings or hand out roles . This is the level most products do not have, which is why HR usually ends up as a full admin.
Manager	Their own team only — attendance, leave, timesheets, approvals. They cannot see the company's salary data.
Employee	Their own record, their own payslips, their own leave. Plus the company org chart, which carries no salary or personal details.

"My team" really means my team	A manager can only act on someone who is both below them and in their department. Level alone would let any manager reach any employee in the company; department alone would let them act on their own department head. A manager attached to no department manages nobody, rather than quietly getting company-wide access.
Custom roles & permissions	Create roles with your own names — "Shift Supervisor", "Regional HR" — and choose exactly what each can do from around 30 separate permissions, such as view attendance, view screenshots, approve overtime or manage settings.
Hierarchy-based approvals	An approver must be senior to the person asking, and nobody approves their own request.
Role assignment control	Only an admin changes roles, and an admin cannot remove their own admin rights — so a company cannot accidentally lock itself out.
Monitoring access scope	A manager sees their own team's captures only — never a colleague at their own level, never someone senior.

Keeping data safe

Multi-tenant data isolation	One company's records are walled off from every other company's, enforced in the data layer itself rather than by remembering to filter — with an automatic test that fails the build if a new record type is ever added without it.
Multi-factor authentication (MFA)	Authenticator app codes with backup codes. A company can make it optional, give a grace period, or require it — and require it for senior roles automatically.
Single sign-on (SAML 2.0)	Staff sign in with the company's existing Microsoft or Google account. Turning it on is a separate deliberate step, because it changes how everyone signs in.
Directory provisioning (SCIM)	Where the company directory is connected, removing someone there revokes their access immediately rather than just marking them inactive — which is the failure that otherwise leaves a leaver reading payroll on Monday.
Audit logging	Every meaningful action recorded with the person, the time and what changed. Payroll changes cannot be edited or deleted after the fact.
Break-glass access	Where someone needs temporary elevated access, it is a time-limited session with a written reason, not a permanent permission quietly granted.
DPDP consent management	Built for the Data Protection Act, where the responsibility sits with the employer rather than the software supplier. Notices are versioned and never edited, consent is separate per type, and it can be withdrawn.
Retention policy	Automatically removed after the retention period the company sets.
API & webhooks	Everything the product does is available to your own systems over a documented interface, with webhooks that notify another system when something happens here.
Seat management	Plan limits are enforced when someone is invited, rather than discovered on the next invoice.
Notifications	In-app, email and mobile push, with a notification centre and the ability to publish an announcement to everyone.

Being straight about this. There is no ISO 27001 certificate or SOC 2 report at present, and no published uptime guarantee. The controls above are built and can be demonstrated; the external audit has not been done.

The four apps

Web

The full system — payroll, attendance, people, hiring, reports and settings. Used by HR, finance, managers and admins.

Mobile — iPhone and Android

Punch in and out, apply for leave, see payslips, approve requests, attendance selfie and notifications. For field staff and for approvals on the move.

Desktop app

Windows, Mac and Linux. Time tracking, screenshots, idle detection, and works offline.

Browser add-on

Chrome. Records which websites were used so activity reports show real detail.

Everything described here is built and working today. Where something has a limit, it is stated in the box marked "worth knowing" rather than left for you to discover later.
